The invention relates to an isolated and purified nucleic acid that encodes a serine protease called D-G protein. The activity of the protein of the invention may be described as cytostatic, antiinflammatory, dermatological and anticoagulation. The serine protease of the invention is a member of the trypsin/chymotrypsin-like (SI) serine protease family, which play an important role in processes such as digestion and regulatory amplification cascades through the proteolytic activation of inactive zymogen precursors. Protease D-G modulating compounds are useful for treating a condition which is mediated by protease D-G, e.g. cancer, skin disorders, neuropathic pain, inflammatory disorders, or coagulation diathesis/thrombosis. The polymolectide encoding the protease is useful for identifying, detecting or isolating mutant forms of DNA molecules encoding the protease. The D-G protein can be used for formulation of compositions for laundry detergents and skin care products. Protease C-G gene therapy may be used to introduce protease D-G into the cells of target organisms. As the D-G protein is derived from a human, it is less likely to produce an allergic reaction in sensitive individuals when used in formulations for laundry detergents and skin care products. The current sequence represents the protease D-G cataytic domain in the construct encoding sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to seripancrin polynucleotides, and polypeptides encoded by them. Seripancrin are members of serine protease family. This protein contains a transmembrane domain, a low density lipoprotein (LDL) domain, protease domain and a scavenger receptor cysteine-rich (SRCR) domain. The LDL and SRCR domains help to define the specificity of seripancrin's intra and intermolecular interactions. The polynucleotides and polypeptides of the invention are useful for treating and diagnosing diseases such as arthritis, chronic obstructive pulmonary disorder (COPD), cancer, osteoporosis, aberrant wound healing, angiogenesis, inflammatory disorders, diabetes, stroke and cardiovascular diseases. Seripancrin genes are useful in chromosome localisation studies, as tools for tissue expression studies and also in gene therapy. The polypeptides of the invention are used for identifying agonists and antagonists useful for treating conditions associated with seripancrin imbalance. These polypeptides are also useful as vaccines. The present sequence is a cDNA coding for seripancrin protein. The seripancrin gene is located on human chromosome 11q22-q23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  783

Detecting a lung cancer-associated transcript in a cell from a patient for treating lung cancer, by contacting a biological sample from the patient with a polynucleotide that exhibits increased or decreased expression in lung cancer - Claim 22; Page 353; 453pp; English.

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polynuclectide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples. Lung cancer-associated polynuclectides and polypeptides are used for identifying a compound that modulates a lung cancer-associated polynuclecting proliferation of a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polynucleotides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polynucleotides of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1066
antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production. The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatoid arthritis, septic shock, pancreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, haematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression, Alzheimer's disease, Parkinson's disease, neurodegenerative and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  110

This nucleotide sequence codes for HUPM-6 (see AAY06437), a novel human protease. HUPM-6 cDNA was initially identified in Incyte Clone 1337018 from the colon cDNA library CoLNNOT13 using a computer search for amino acid sequence alignments. The present sequence is a consensus sequence derived from overlapping and/or extended nucleic acid sequences: Incyte Clones 1271725 (TESTTUT02), 1337018, 586982 and 588598 (UTRSNOT01). A fragment comprising nucleotides 900-949 of the present sequence can be used for hybridisation. This sequence encompasses an active site residue. Northern analysis shows expression of HUPM-6 in gastrointesinal, and male an female reproductive cDNA libraries. Approximately 65% of these libraries are associated with neoplastic disorders, and 22% with the immune response. The invention provides 12 new human proteases, i.e. HUPM-1 to -12 (see AAY06432-43), and the polynucleotides encoding them (see AAX87149-60). Also provided are vectors, host cells and methods for producing HUPM polypeptides, as well as agonists and antagonists of HUPM. Methods for treating or them are allowed.
                                                                                                                                                                                                                                                                                                                                                                                         ь.

New mammalian DNA sequerreted PRO polypept: small molecule inhibit

uences encoding transmembrane, receptor or ides, useful for screening of potential peptide or tors of the relevant receptor/ligand interactions

The AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.

PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, breast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Lys1leValGlyGlyTyrAlaLeuAspValAspSerTrpProTrpGlnValSerIleGln

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAS45925-AAS46231 represent DNA molecules encoding and PCR primers for PRO polypeptides of the invention. The sequences of the invention can be used to detect the presence of a tumour in a mammal by comparing the level of expression of a PRO polypeptide in a test sample of cells from the animal and a control sample of normal cells, whereby a higher level of expression in the test sample indicates the presence of a tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals to screen for modulators of the compounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gurney

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is the coding sequence for a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             90
                                                                                            brane proteins and nucleic acids designated PRO, on probes, in chromosome and gene mapping and gene
                                                                                                                                                                                               The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of anti-sense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nucleic acids may also be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    eGln

The invention relates to an isolated secreted and renamembrane PRO polypeptide having 80% sequence identity to a sequence appearing as ABG58581-ARG59540 or their associated signal peptide. Or a sequence of an extracellular domain of the proteins with their associated signal peptide or lacking its associated signal peptide. Also included are newtracellular domain of the proteins with their associated signal peptide of a proteins, vetors, host cells, this calds encoding the proteins and antihodise which specifically bind to the proteins. The proteins are useful for detecting a polypeptide designated as A, B, C or D in a sample suspected of containing an A, B, C or D polypeptide, or D in a sample suspected of containing the formation of the compage is indicative of the presence of an A, B, C or D polypeptide, or D/I polypeptide conjugate in the sample where A is a PRO1072 polypeptide, B is a PRO2040 polypeptide, In the Sample where A is a PRO1072 polypeptide, B is a PRO5010 polypeptide, H is a PRO5050 polypeptide, D is a PRO3070 polypeptide, In the Sample comparises a cell suspected of expressing the A, B, C or D polypeptide, The E, P, G, H or I polypeptide is labeled with a detectable label or is attached to a soil susport. The proteins are polypeptide, and a store of the A, B, C or D or E, P, G, H or I. The bioactive molecule is a toxin, a radiolabel or an antibody. The bioactive molecule as a toxin, a radiolabel or an antibody. The bioactive molecule against them are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, P, G, H or I, or antibodies adminst them are useful for modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, P, G, H, or I. The cell is killed. The proteins are useful for identifying and as a toxin, a radiolabel or a modulating a biological activity of a cell expressing a polypeptide designated as A, B, C or D or E, P, G, H, or I. The cell is killed. The proteins are useful for protein are

polypeptides which are -associated antigenic target recancer therapy and diagnosis Novel isolated tumour-useful as targets for

English Claim 1; Fig 2; 121pp

The invention relates to an isolated tumour-associated antigenic target polypeptide (TAT) (1), specifically TAT134-TAT138 polypeptides, and the polypeptide (TAT) (1), specifically TAT134-TAT138 polypeptides, and the polypucidectides (II) encoding them. (II) is useful for diagnosing the presence of a tumour in a mammal, where the level of expression of (II) is indicative on the presence of tumour in the mammal from which the test sample was obtained. Antibody to (I) is useful for killing a cancer cell, a breast cancer cell, a central nervous system (CNS) cancer cell, a liver cancer cell, a bladder cancer cell, a pancreatic cancer cell, a melanoma cell or a leukaemia cell) that expresses (I). Oligonucleotides hybridising to (II) are useful as diagnostic probes, antisense hybridising to (II) is also useful in chromosome and gene mapping and in the generation of antisense RNA and DNA probes, for constructing the generation of antisense RNA and DNA probes, for constructing cancer cell in a malysis of individuals with genetic disorders. (II) is also useful for generating either transgenic animals or knockout animals, and in gene therapy. The TAT polypeptides and nucleic acids may also be used for tissue typing and the TAT polypeptides are useful for screening compounds that mimic the TAT polypeptide (agonist) or prevent the effect of TAT polypeptide from cells, for detection and quantitation of TAT polypeptide from cells, for detection and quantitation of TAT polypeptide from cells, in an enzyme linked immunosorbent assay (ELISA) or Western blot. The antibodies are also useful for treating a TAT-expressing cancer or alleviating one or more symptoms of cancer in a mammal. The present sequence represents the

The invention relates to an antibody that binds to a polypeptide with a fully defined sequence given in the specification. The methods and compositions (containing antibodies that specifically bind a PRO polypeptide) of the present invention are useful for the preparation of medicament for the treatment of disorders associated with the aberrant expression or activity of the PRO polypeptide, such as tumour conditions and cancer. They can also be used to generate transgenic or knockout animals useful in the development and screening of therapeutically useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated antibody specifically binding a PRO polypeptide, useful for the preparation of a medicament for treating disorders with the aberrant expression or activity of the PRO polypeptide, such as tumor conditions and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1403
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GGCTGCGGGGCCCCGAGCACCCCAGGAGTATACACCAAGGTCTCA 1463
        molecular weight markers for protein electrophoresis, chromosome dentification and tissue typing. The PRO polypeptides are useful to identification and tissue typing. The PRO polypeptides are useful to induce angiogenesis e.g wound healing, in the treatment of sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis; diabetes; hyperinsulinaemia and hypoinsulinaemia. The antibodies may be used in various diagnostic, competitive binding and/or immunoprecipitation assays. The present sequence represents a cDNA encoding a PRO polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   863

The invention describes novel isolated PRO polypeptides. The PRO polypeptides or anti-PRO antibodies are useful in preparing a medicament for treating a condition that is responsive to the PRO polypeptide or antibody. The PRO nucleotide sequences may be used as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This sequence encodes a novel human secreted and transmembrane PRO polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         923

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GlnGlyAspSerGlyGlyProLeuMetTyrGlnSerAspGlnTrpHisValValGlyIle
   and
                                                                                           The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polynucleotides are useful for preparing a medicament useful in the treatment of a condition responsive to anti-PRO antibody. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ACA63373-ACA63456 represent cDNA sequences encoding the human PRO polypeptides of the invention.
ide, useful for detecting and purifying the polypeptide treating conditions responsive to the antibody -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MetTyrProLysAspAspIleAlaLeuMetLysLeuGlnPheProLeuThrPheSer
RESULT 2
US-09-656-002-1
i Sequence 1, Application US/09656002
i Sequence 1, Application US/09656002
i Patent No. 6455668
i GENERAL INFORMATION:
i APPLICANT: Milson, Keith
i APPLICANT: Wilson, Keith
i TITLE OF INVENTION: NOVEL METHODS OF DIAGNOSING COLORECTAL CANCER, COMP
TITLE OF INVENTION: OF SCREENING FOR COLORECTAL CANCER MODULATORS
i TITLE OF INVENTION: OF SCREENING FOR COLORECTAL CANCER MODULATORS
i TILLE OF INVENTION: OF SCREENING FOR COLORECTAL CANCER MODULATORS
i FILE REFERENCE: A-69108/DJB/AMS
i CURRENT FILING DATE: 2000-09-06
i PRIOR FILING DATE: 2000-03-15
i PRIOR FILING DATE: 2000-01-28
i PRIOR FILING DATE: 2000-01-28
i PRIOR FILING DATE: 2000-03-15
i NUMBER OF SEQ ID NOS: 3
i SOFTWARE: Patentin version 3.0
i LENGTH: 2079
i TYPE: DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Length:

3-09-387-375-8
Sequence 8, Application US/09387375
Patent No. 6485957
GENERAL INFORMATION:
APPLICANT: Darrow, Andrew
APPLICANT: Andrade-Gordon, Patricia
APPLICANT: Qi, Jenson
TITLE OF INVENTION: DNA Encoding the Human S
TITLE OF INVENTION: Protease BOS
FILE REFERENCE: ORT-1031
CURRENT APPLICATION NUMBER: US/09/387,375
CURRENT FILING DATE: 1999-08-31
NUMBER OF SEQ ID NOS: 9
SOFTWARE: PatentIn Ver. 2.0
                                                                                                                                                                                                                                                                                                               Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4.45e-75

Patent No. 6420157

GENERAL INFORMATION:

APPLICANT: Darrow, Andrew

APPLICANT: Qi, Jenson

APPLICANT: Andrade-Gordon, Patricia

TITLE OF INVENTION: Zymogen Activation System

FILE REFERENCE: ORT-1028

CURRENT APPLICATION NUMBER: US/09/386,642

CURRENT FILING DATE: 1999-08-31

NUMBER OF SEQ ID NOS: 60

SOFTWARE: Patentin Ver. 2.0
